

## DMT fumarate to freebase DMT

1. 100mg dmt fumarate used for freebasing

(note that this is the fumarate salt made from yellowish dmt, hence the yellowish colour to it!)

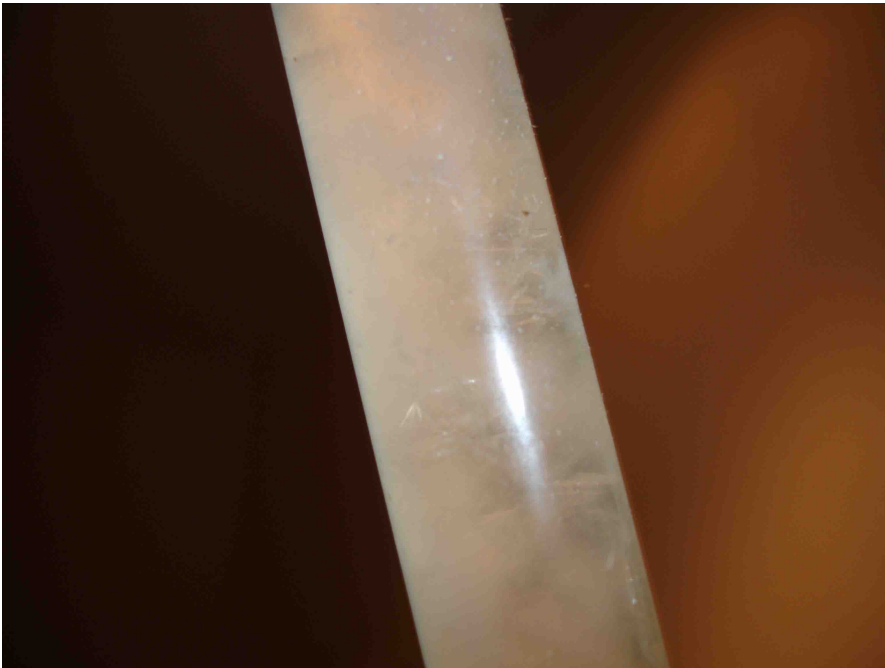

2. 10ml of tap water were added to dissolve it

3. A solution of concentrated  $\text{Na}_2\text{CO}_3$  (cannot remember how much  $\text{Na}_2\text{CO}_3$  was added in water, but it was a lot) was added in the dissolved dmt fumarate solution using an eye dropper. The solution became basic, and the alkaloids crashed out as a cloud.

4. Solution was left to settle for few days.

Next day, one can already notice the crystals forming inside the basified solution

### 5. Day 3

The crystals have fallen to the bottom, they are ready for collection.

From this point, one can simply

- a) filter the solution through a coffee filter,
- b) retrieve the crystals by dissolving them in acetone
- c) evaporate the acetone to get the freebase

Enjoy!!!!
